

Transitioning to full-stack development and server-side integration demonstrated how backend architecture connects with frontend user interfaces. Configuring an Express server, establishing database schemas, and implementing CRUD operations provided hands-on experience in managing data flow. Handling database connections and environment configurations initially required careful debugging to ensure seamless communication between the client and server. Resolving these deployment challenges emphasized the importance of proper server routing and error handling during production builds. Finally, deploying the application live on Render successfully completed the development cycle, with the project now accessible at "https://it-112-week7-fullstackstarter-lab-26eg.onrender.com/".
