Hello, Im Edgar Anter!

This serves as a simple HTML page for the first week of the course.

Setting up the development environment highlighted the importance of having an organized workspace before writing code. Working with different text editors provided a clear understanding of how basic web pages are structured and rendered in the browser. Managing initial extension settings required taking a step back to troubleshoot configuration issues systematically. This process demonstrated that proper file organization and tool preparation save significant time down the line. Finally, applying custom branding helped align the technical setup with the visual standards required for the portfolio compilation.
